

Attorney's Docket No. K&A 23-0117
Client's Docket No. 14200

APPLICATION

FOR UNITED STATES LETTERS PATENT

SPECIFICATION

TO ALL WHOM IT MAY CONCERN:

BE IT KNOWN THAT I, **GERALDINE DOWDLE**, a citizen of
UNITED STATES OF AMERICA, have invented a new and useful
PORTABLE AC POWER SYSTEM of which the following is a
specification:

PORTABLE AC POWER SYSTEM

5

BACKGROUND OF THE INVENTION

Field of the Invention

10

The present invention relates to electrical service extension devices and more particularly pertains to a new portable ac power system for providing cordless remote electrical power.

15 Description of the Prior Art

20

The use of electrical service extension devices is known in the prior art. U.S. Patent No. 6,077,109 describes a device providing remote electrical power, but requiring an cord assembly as an extension from a conventional outlet.

25

While these devices fulfill their respective, particular objectives and requirements, the need remains for a system that allows conventional household electrical items to be run without a wired connection to a conventional outlet.

SUMMARY OF THE INVENTION

The present invention meets the needs presented above by providing an electrical storage device coupled with an inverter for providing cordless electrical power where desired.

Another object of the present invention is to provide a new portable ac power system that provides an indication of when recharging of the energy storage devices is complete.

Even still another object of the present invention is to provide a new portable ac power system that can be used without special electrical connections.

To this end, the present invention generally comprises a pair of portable power supply devices, and a recharging assembly. The pair of portable power supply devices each including a portable housing, an outlet, and an energy storage assembly, the outlet is designed for coupling with conventional electrical plugs. The recharging assembly is electrically couplable to a conventional household ac outlet. The recharging assembly is preferably electrically couplable to each one of the pair of portable power supply devices. The energy storage assembly is for recharging the portable power supply devices.

There has thus been outlined, rather broadly, the more important features of the invention in order that the detailed description thereof that follows may be better understood, and in order that the present contribution to the art may be better appreciated. There are additional features of the invention that

will be described hereinafter and which will form the subject matter of the claims appended hereto.

5 The objects of the invention, along with the various features of novelty which characterize the invention, are pointed out with particularity in the claims annexed to and forming a part of this disclosure.

BRIEF DESCRIPTION OF THE DRAWINGS

10

The invention will be better understood and objects other than those set forth above will become apparent when consideration is given to the following detailed description thereof. Such description makes reference to the annexed drawings wherein:

15

Figure 1 is a schematic perspective view of a new portable ac power system according to the present invention.

20

Figure 2 is a schematic top view of the present invention.

Figure 3 is a schematic functional interconnect of the present invention.

DESCRIPTION OF THE PREFERRED EMBODIMENT

25

With reference now to the drawings, and in particular to Figures 1 through 6 thereof, a new portable ac power system embodying the principles and concepts of the present invention and generally designated by the reference numeral 10 will be described.

30

As best illustrated in Figures 1 through 6, the portable ac power system 10 generally comprises a pair of portable power supply devices 20, and a recharging assembly 30.

The recharging assembly 30 is electrically couplable to a conventional household ac outlet. The recharging assembly 30 is preferably electrically couplable to each one of the pair of portable power supply devices 20. The recharging assembly 30 is for recharging the portable power supply devices 20.

The recharging assembly 30 further comprises a case 32 with a main portion 33 and a lid portion 34. Preferably, the main portion 33 includes a pair of cavities 35. Each one of the pair of cavities 35 is for selectively receiving an associated one of the pair of portable power supply devices 20. The recharging assembly 30 includes an electrical cord assembly 38 extending from the main portion 33 for selectively coupling to a conventional household outlet.

In a preferred embodiment, the recharging assembly 30 has a handle member 40 to facilitate transport of the system 10.

A pair of charge indicators 36 may be positioned in the main portion 33 of the recharging assembly 30. Each one of the pair of charge indicators 36 is electrically couplable to an associated one of the pair of portable power supply devices 20 for indicating an amount of electrical energy stored in the portable power supply devices 20.

In an embodiment each one of the pair of portable power supply devices 20 further comprises a portable housing 21, an outlet 22, and an energy storage assembly 23. The portable housing 21 defines an interior space, and includes a top wall. The outlet 22

is preferably positioned on the top wall of the housing 21. The outlet 22 is designed for coupling with conventional electrical plugs.

5 An energy storage assembly 23 is positioned within the housing 20. The energy storage assembly 23 is electrically coupled to the outlet 22 and supplies electrical energy to the outlet 22.

10 In a further embodiment each one of the pair of energy storage assemblies 23 further comprises an energy storage means 24, and an inverter assembly 26. The energy storage means 24 is preferably positioned within the portable housing 21. The energy storage means 24 stores electrical energy until needed by a user. The inverter assembly 26 is electrically coupled between the energy
15 storage means 24 and the outlet 22. The inverter assembly 26 converts dc electrical current from the energy storage means 24 to ac current for the outlet 22. The inverter assembly 26 is positioned within the portable housing 21.

20 The energy storage means 24 may be a battery, capacitor, fuel cell, or any other appropriate device.

25 With respect to the above description then, it is to be realized that the optimum dimensional relationships for the parts of the invention, to include variations in size, materials, shape, form, function and manner of operation, assembly and use, are deemed readily apparent and obvious to one skilled in the art, and all equivalent relationships to those illustrated in the drawings and described in the specification are intended to be encompassed by
30 the present invention.

Therefore, the foregoing is considered as illustrative only of the principles of the invention. Further, since numerous modifications and changes will readily occur to those skilled in the art, it is not desired to limit the invention to the exact construction and operation shown and described, and accordingly, all suitable modifications and equivalents may be resorted to, falling within the scope of the invention.
